10. We would like to visit the museum (will like, would like)...
11. My brother is studying for his test now. (is studying, was studying).
12. I have finished my homework already (have finished, have been finishing).

Agriculture, the backbone of many economies, is highly vulnerable to climate change. Rising temperatures, irregular rainfall, and frequent droughts have already reduced crop yields in several regions. Farmers who rely on seasonal rainfall face uncertainty about when to sow and harvest. Changes in climate also promote the spread of pests and plant diseases, further affecting productivity. In developing countries, small farmers are particularly at risk as they lack the resources to adapt to these changes. To address these challenges, scientists and policymakers are promoting climate-resilient agriculture. This includes developing drought-resistant crop varieties, adopting efficient irrigation systems, and integrating renewable energy into farming. Governments are also encouraged to provide weather information and financial support to smallholders. The future of food security depends on how effectively societies can adapt agriculture to a changing climate.

Questions:

1. How does climate change affect agriculture?
 2. What difficulties do small farmers face according to the passage?
 3. What is meant by "climate-resilient agriculture"?
 4. Name two ways to make farming more adaptable to changing climates.
 5. Suggest a suitable title to this passage.
